ABSTRACT

Thesis of 54 pages, 12 tables, 16 drawings, 47 sources.

NANOTECHNOLOGIES, NANOPARTICLES, MICROCELLS, "NANOPLANT", KOPLEKSNY PREPARATION, ANTISTRESS ACTION, IONS OF CHLORINE AND CADMIUM, GROWTH AND DEVELOPMENT, BIOCHEMICAL INDICATORS.

As object of research plants and seeds of crops served (a lupine, a rye, barley, tomatoes, cucumbers, onions, etc.).

The purpose of this work was studying of influence of nanoparticles of microcells on morphometric and biochemical indicators of growth and development of plants.

The main methods of research were determination of activity of neutral proteinases, trypsin inhibitors, BAPAuti, proline, peroxidase, a catalase.

In a result of the carried-out work it is established that use of the Nanoplant microfertilizer at incrustation of seeds at an expense of 6 g/t provided growth of productivity of summer barley and a spring-sown field by 1,8 and 2,2 c/hectare concerning the Background. Results of researches showed also efficiency of application of a preparation on vegetable cultures. The preparation has positive effect at cultivation of seedling of a tomato and a cucumber of the discovered and closed soil. The conducted researches allowed to establish also antistress character of a preparation. Use of a preparation reduces action of ions of chlorine for 40%. It is shown that the mechanism of adaptogeny action of a preparation is connected with increase of activity of neutral, alkaline proteases, the general antioxidant activity of plants. Researches showed also efficiency of action of separate nanoparticles of microcells as on morphometric, and biochemical indicators of plants.
